**Math 5651. Lecture 001 (V. Reiner) Midterm Exam I
Tuesday, September 28, 2010**

This is a 115 minute exam. No books, notes, calculators, cell phones or other electronic devices are allowed. There are a total of 100 points. To get full credit for a problem you must show the details of your work. Answers unsupported by an argument will get little credit. Do all of your calculations on this test paper.

| Problem | Score |
|---------|-------|
| 1. | _____ |
| 2. | _____ |
| 3. | _____ |
| 4. | _____ |
| 5. | _____ |
| 6. | _____ |
| 7. | _____ |
| Total: | _____ |

Problem 1. (*10 points total*) When rolling a fair 6-sided dice having 1, 2, 3, 4, 5, 6 on its sides, consider the two events A , B where A is rolling an even number, and B is rolling a number divisible by three. Are A and B dependent or independent? You must support your answer with calculations to receive any credit.

Problem 2. (*15 points total; 5 points each*) Compute the probabilities of the following events when rolling 8 times repeatedly a fair 6-sided dice as in Problem 1. Your answer in each case can be left as a fraction—you do not need to convert it to a decimal.

- a. (5 points) The sum of the numbers rolled is exactly 8.
- b. (5 points) The sum of the numbers rolled is exactly 9.
- c. (5 points) Each of the six values appears this many times:

| | | | | | | |
|-----------------------|---|---|---|---|---|---|
| value | 1 | 2 | 3 | 4 | 5 | 6 |
| number of occurrences | 0 | 2 | 4 | 1 | 0 | 1 |

Problem 3. (*15 points total*) Prove that if the events A, B, C are independent, then the events A and $B^c \cup C$ are also independent.

Problem 4. (15 points total) A fair coin with alternatives heads or tails (H or T) is flipped 10 times repeatedly. Let A be the event that exactly 8 heads occur among the 10 flips, and let B be the event that the first three flips are (H, T, H) .

a. (7 points) Compute the probability $\Pr(A)$.

b. (8 points) Compute the conditional probability $\Pr(A|B)$.

Problem 5. (15 points) For four events A_1, A_2, A_3, A_4 , express the conditional probability $\Pr(A_1 \cup A_2 \cup A_3 | A_4)$ in terms of any or all of these probabilities: $\Pr(A_i)$, $\Pr(A_i A_j)$, $\Pr(A_i A_j A_k)$ and $\Pr(A_1 A_2 A_3 A_4)$.

Problem 6. (15 points total; 5 points each) A radioactive material is emitting particles, and each particle independently has a $\frac{1}{7}$ chance of penetrating through a shield. What are the probabilities of the following events?

a. (5 points) After 100 emissions, exactly 4 particles have penetrated.

b. (5 points) After 100 emissions, at least two particles have penetrated.

c. (5 points) The first particle that penetrates is the k^{th} one emitted.
(Your answer should be a function of k .)

Problem 7. (15 points) At your favorite restaurant, there are three possible chefs, Emeril Lagasse, Bobby Flay, and Rick Bayless. They are randomly scheduled each week for which of the 7 evenings they will work, although each works a different number of days. Also, each has their own well-established percentage chance of overcooking the asparagus. This information is summarized here:

| chef | Lagasse | Flay | Bayless |
|------------------------------------|---------|------|---------|
| number of evenings worked per week | 1 | 4 | 2 |
| % chance of overcooking asparagus | 100 | 20 | 50 |

If the asparagus that you ordered was overcooked, what's the probability that Emeril Lagasse was the chef that evening?

Brief solutions:

1. Calculate

$$S = \{1, 2, 3, 4, 5, 6\}$$

$$A = \{2, 4, 6\} \text{ so } \Pr(A) = \frac{3}{6} = \frac{1}{2}$$

$$B = \{3, 6\} \text{ so } \Pr(B) = \frac{2}{6} = \frac{1}{3}$$

$$AB = \{6\} \text{ so } \Pr(AB) = \frac{1}{6} = \frac{1}{2} \cdot \frac{1}{3} = \Pr(A) \Pr(B)$$

so, yes, they're independent.

2. $|S| = 6^8$.

(a) The event A of rolling a sum of 8 can only occur as $(1, 1, 1, 1, 1, 1, 1, 1)$, so $\Pr(A) = \frac{1}{6^8}$.

(b) The event B of rolling a sum of 9 can only occur in these 8 different ways $(2, 1, 1, 1, 1, 1, 1, 1), (1, 2, 1, 1, 1, 1, 1, 1), \dots, (1, 1, 1, 1, 1, 1, 1, 2)$ so $\Pr(B) = \frac{8}{6^8}$.

(c) Choosing die rolls for this event C is the same as choosing a word with letters 1, 2, 3, 4, 5, 6 having each letter occur as many times as in the table, so $\Pr(C) = \frac{\binom{8}{0,2,4,1,0,1}}{6^8} = \frac{8!}{6^8 \cdot 2!4!1!1!}$.

3. We need to show that $\Pr(A(B^c \cup C)) = \Pr(A) \Pr(B^c \cup C)$, so for example, we could just try to compute both sides in terms of intersection probabilities:

$$\begin{aligned} \Pr(B^c \cup C) &= \Pr(B^c) + \Pr(C) - \Pr(B^c C) \\ &= 1 - \Pr(B) + \Pr(BC) \text{ since } C = BC \sqcup B^c C \\ &= 1 - \Pr(B) + \Pr(B) \Pr(C) \text{ due to independence of } B, C. \end{aligned}$$

meanwhile

$$\begin{aligned} \Pr(A(B^c \cup C)) &= \Pr(AB^c \cup AC) \\ &= \Pr(AB^c) + \Pr(AC) - \Pr(AB^c AC) \\ &= \Pr(A) - \Pr(AB) + \Pr(AC) - \Pr(AB^c C) \text{ since } A = AB \sqcup AB^c \\ &= \Pr(A) - \Pr(AB) + \Pr(ABC) \text{ since } AC = ABC \sqcup AB^c C \\ &= \Pr(A) - \Pr(A) \Pr(B) + \Pr(A) \Pr(B) \Pr(C) \text{ due to independence of } A, B, \\ &= \Pr(A)(1 - \Pr(B) + \Pr(B) \Pr(C)) \\ &= \Pr(A) \Pr(B^c \cup C) \end{aligned}$$

as desired.

4. Event A is exactly 8 heads occur among the 10 flips, and event B is that the first three flips are (H, T, H) .

$$(a) \Pr(A) = \binom{10}{8} \left(\frac{1}{2}\right)^8 \left(\frac{1}{2}\right)^2 = \frac{\binom{10}{8}}{2^{10}}.$$

$$(b) \Pr(A|B) = \frac{\Pr(AB)}{\Pr(B)} = \frac{\frac{1}{2^3} \cdot \frac{\binom{7}{6}}{2^7}}{\frac{1}{2^3}} = \frac{\binom{7}{6}}{2^7} = \frac{7}{2^7}.$$

Thinking about it (slightly) differently, let C be the event that the last seven flips contain exactly 6 heads. Then one has $A = BC$ with B, C independent, so $\Pr(A|B) = \Pr(BC|B) = \Pr(C|B) = \Pr(C) = \frac{\binom{7}{6}}{2^7} = \frac{7}{2^7}.$

5.

$$\begin{aligned} \Pr(A_1 \cup A_2 \cup A_3 | A_4) &= \frac{\Pr((A_1 \cup A_2 \cup A_3) \cap A_4)}{\Pr(A_4)} \\ &= \frac{1}{\Pr(A_4)} [\Pr((A_1 A_4) \cup (A_2 A_4) \cup (A_3 A_4))] \\ &= \frac{1}{\Pr(A_4)} [\Pr(A_1 A_4) + \Pr(A_2 A_4) + \Pr(A_3 A_4) \\ &\quad - \Pr(A_1 A_2 A_4) - \Pr(A_1 A_3 A_4) - \Pr(A_2 A_3 A_4) \\ &\quad + \Pr(A_1 A_2 A_3 A_4)] \end{aligned}$$

$$6. (a) \Pr(\text{exactly 4 penetrated}) = \binom{100}{4} \left(\frac{1}{7}\right)^4 \left(\frac{6}{7}\right)^{96}$$

(b)

$$\Pr(\text{at least two penetrated}) = 1 - \Pr(\text{zero or one penetrated})$$

$$= 1 - \binom{100}{0} \left(\frac{1}{7}\right)^0 \left(\frac{6}{7}\right)^{100} - \binom{100}{1} \left(\frac{1}{7}\right)^1 \left(\frac{6}{7}\right)^{99}$$

(c)

$$\begin{aligned} &\Pr(\text{first penetrating particle is the } k^{\text{th}} \text{ emitted}) \\ &= \Pr(\text{first } k-1 \text{ emitted don't penetrate, but } k^{\text{th}} \text{ does}) \\ &= \left(\frac{6}{7}\right)^{k-1} \frac{1}{7} \end{aligned}$$

6. Let L, F, B be the events that Lagasse, Flay, Bayless was chef, and O the event that the asparagus was overcooked. Then Bayes' Theorem

says

$$\begin{aligned}\Pr(L|A) &= \frac{\Pr(A|L) \Pr(L)}{\Pr(A|L) \Pr(L) + \Pr(A|F) \Pr(F) + \Pr(A|B) \Pr(B)} \\ &= \frac{(1.00)(\frac{1}{7})}{(1.00)(\frac{1}{7}) + (.20)(\frac{4}{7}) + (.50)(\frac{2}{7})} = \frac{5}{14}.\end{aligned}$$
