WHAT SECTION ARE YOU IN?

Closed book, closed notes, no calculators/PDAs; no reference materials of any kind. Turn off all handheld devices, including cell phones.

Show work; a correct answer, by itself, may be insufficient for credit. Arithmetic need not be simplified, unless the problem requests it.

I understand the above, and I understand that cheating has severe consequences, from a failing grade to expulsion.

- III. 1.
- III. 2.
- III. 3,4.

III. Computations. Show work. Unless otherwise specified, answers must be exactly correct, but can be left in any form easily calculated on a standard calculator.

1. (10 pts) Compute 
$$\frac{d}{dx} \left[ \frac{2x^3 - 8}{\arctan x} + xe^{\sin x} \right]$$

2. (10 pts) Using implicit differentiation (and logarithmic differentiation), find y'=dy/dx, assuming that  $(2+y^2)^{xy}=9$ .

3. (5 pts) Suppose f is 1-1 and  $g = f^{-1}$  is the inverse of f. Suppose f(3) = 4 and f'(3) = 64. Compute g(4) and g'(4).

4. (10 pts) Find the maximal intervals of increase and decrease for  $f(x) = x^3 - 6x^2 + 5$ .

5. (10 pts) Among all pairs of positive numbers x and y such that xy = 100, find the global maximum value of x + 4y, provided it exists. Then find the global minimum value, provided it exists. (NOTE: If the global maximum value does not exist, you need to state that clearly to receive full credit. If it does exist, for full credit, you'll need to compute x + 4y; computing x and/or y alone is insufficient. These same comments apply to the global minimum value.)
