

### Global Annual Average Insolation

K Watts Solar output:

Solar intensity at distance  $\,r\,$  from the sun:

once 
$$r$$
 from the sun:  

$$Q(t) = \frac{K}{4\pi r(t)^2} \text{ Wm}^{-2}$$

Cross section of Earth:

 $\frac{Kr_E^2}{4r(t)^2} \quad \mathbf{W}$ Global solar input:

Total annual solar input (P =one year (in seconds)):

$$\int_{0}^{P} \frac{Kr_{E}^{2}}{4r(t)^{2}} dt = \frac{Kr_{E}^{2}}{4} \int_{0}^{P} \frac{dt}{r(t)^{2}}$$
 Joules

### **Glacial Cycles**

#### Global Annual Average Insolation

Specific angular momentum (angular momentum per unit mass):

$$\Omega = r^2 \dot{\theta} \quad \text{m}^2 \text{s}^{-1}$$

Total annual solar input:

$$\frac{Kr_E^2}{4} \int_0^P \frac{dt}{r(t)^2} = \frac{Kr_E^2}{4} \int_0^P \frac{\dot{\theta}dt}{\Omega} = \frac{Kr_E^2}{4\Omega} \int_0^{2\pi} d\theta = \frac{\pi Kr_E^2}{2\Omega} \quad \text{Joules}$$

4 
$$\int_0^{} r(t)^2$$
 4  $\int_0^{} \Omega$  4 $\Omega$   $\int_0^{} \Phi$  Mean annual solar input: 
$$\frac{\pi K r_E^2}{2P\Omega} \quad \text{Watts}$$

Mean annual solar intensity on the Earth's surface:

$$\frac{\pi K r_E^2}{2P\Omega} \cdot \frac{1}{4\pi r_E^2} = \frac{K}{8P\Omega} \quad \text{Wm}^{-2}$$

# **Glacial Cycles**

### **Global Annual Average Insolation**

Kepler's Third Law:

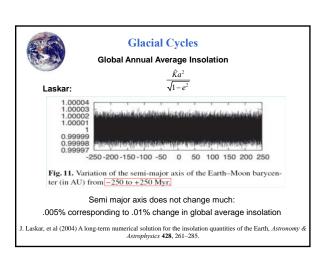

$$P \sim a^{-3/2}$$
  $a = \text{semimajor axis}$ 

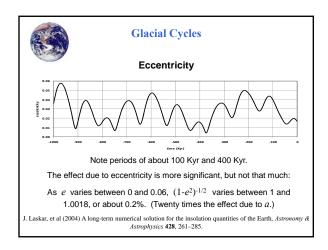

Derived from Kepler:

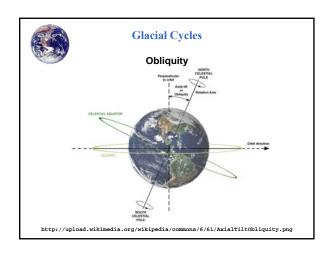

$$1 - e^2 \sim a\Omega^2$$
  $e = \text{eccentricity}$ 

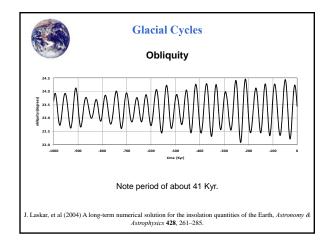

Mean annual solar intensity:

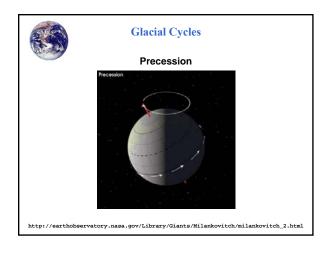

$$\frac{K}{8P\Omega} = \frac{\hat{K}a^{3/2}a^{1/2}}{\sqrt{1 - e^2}} = \frac{\hat{K}a^2}{\sqrt{1 - e^2}} \quad \text{Wm}^{-2}$$

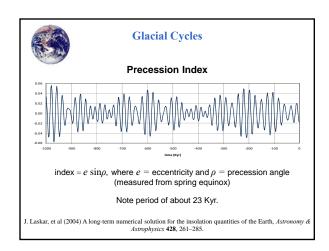

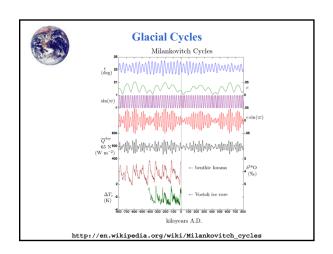

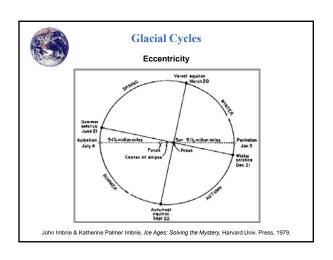

# Daily Average Insolation at Summer Solstice at 65° N

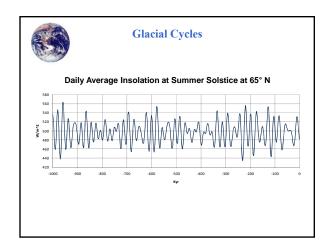

Insolation at a point on the Earth's surface

 $I(\beta, \rho, r, \theta, \varphi, \gamma) = \frac{K}{4\pi r^2} \left[ -\cos\varphi(\cos\beta\cos(\theta - \rho)\cos\gamma + \sin(\theta - \rho)\sin\gamma) - \sin\varphi\sin\beta\cos(\theta - \rho) \right]^{+}$ 

$$\begin{split} (\varphi,\gamma) &= (\text{latitude, longitude}) \\ (r,\theta) &= \text{position of Earth in orbital plane} \\ \beta &= \text{obliquity angle} \\ \rho &= \text{precession angle} \end{split}$$

Daily average insolation at latitude  $\phi$  at summer solstice

$$\overline{I}\left(e,\beta,\rho',\varphi\right) = Q\frac{\left(1-e\sin\rho'\right)^2}{\left(1-e^2\right)^2}\frac{1}{2\pi}\int_0^{2\pi}\left[\cos\varphi\cos\beta\cos\gamma + \sin\varphi\sin\beta\right]^{+}d\gamma$$

#### Who was Milankovitch?

Milutin Milankovitch was a Serbian mathematician and professor at the University of Belgrade.

In 1920 he published his seminal work on the relation between insolation and the Earth's orbital parameters.

In 1941 he published a book explaining his entire theory.

His work was not fully accepted until 1976.

# What happened in 1976?

Hays, Imbrie, and Shackleton, "Variations in the Earth's Orbit: Pacemaker of the Ice Ages," *Science* **194**, 10 December 1976.

"It is concluded that changes in the earth's orbital geometry are the fundamental cause of the succession of Quaternary ice ages."

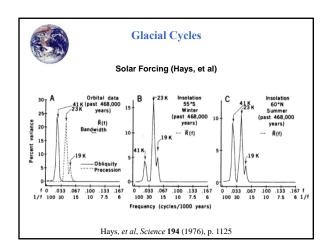

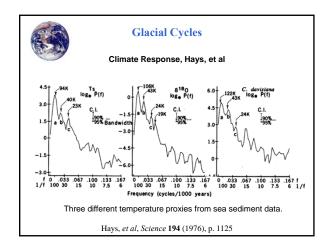

ames D. Hays

John Imbrie

Nicholas Shackleto

Hays, et al, Summary

- Three indices of global climate have been monitored in the record of the past 450,000 years in Southern Hemisphere ocean-floor sediments.
- climatic variance of these records is concentrated in three discrete spectral peaks at periods of 23,000, 42,000, and approximately 100,000 years. These peaks correspond to the dominant periods of the earth's solar orbit, and contain respectively about 10, 25, and 50 percent of the climatic variance.

Hays, et al, Science 194 (1976), p. 1125

### **Glacial Cycles**

Hays, et al, Summary

- The 42,000-year climatic component has the same period as variations in the obliquity of the earth's axis and retains a constant phase relationship with it.
- The 23,000-year portion of the variance displays the same periods (about 23,000 and 19,000 years) as the quasiperiodic precession index.
- 5) The dominant, 100,000-year climatic component has an average period close to, and is in phase with, orbital eccentricity. Unlike the correlations between climate and the higher-frequency orbital variations (which can be explained on the assumption that the climate system responds linearly to orbital forcing), an explanation of the correlation between climate and eccentricity probably requires an assumption of nonlinearity.

Hays, et al, Science 194 (1976), p. 1125

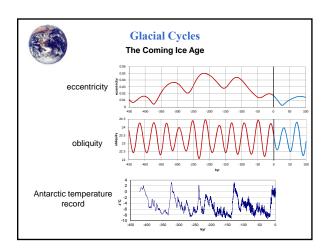

# **Glacial Cycles**

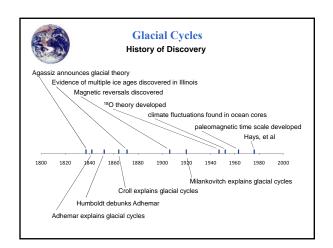

Hays, et al, Summary

- 6) It is concluded that changes in the earth's orbital geometry are the fundamental cause of the succession of Quaternary ice ages.
- 7) A model of future climate based on the observed orbital-climate relationships, but ignoring anthropogenic effects, predicts that the long-term trend over the next seven thousand years is toward extensive Northern Hemisphere claciation\*.
