

11/16/18

On Wednesday, we discussed how to build a family of graphs  $G_n^{r,s,N}$  out of Aztec Diamonds such that

$$X_n = \sum_{\substack{M \text{ perfect} \\ \text{matching of } G_n^{r,s,N}}} x(M) y(M) \quad \text{where } x_n \text{ satisfies the Gale-Robinson (from principal coeffs)}$$

$$X_n X_{n-N} = X_{n-r} X_{n-N+r} + \prod_{i=1}^N y_i X_{n-s} X_{n-N+s}$$

An equivalent construction for  $G_n^{r,s,N}$  can be given as:

1) Define  $H^{(r,s,N)}$  to be the induced subgraph on tiling  $\tau^{(r,s,N),n}$  dual to GR quiver assoc. to  $(r,s,N)$ , with unit height, width  $\geq \lfloor \frac{n-N+1}{r} \rfloor + 1$ , placed so the leftmost square is  $\bar{n} := (n-N) \bmod r$  [called a Horizontal Strip]

E.g.'s for Somos-5 ( $r=1, s=2, N=5$ )

$$H_6^{(1,5)} = \boxed{1}, \quad H_7^{(1,5)} = \boxed{1 \begin{array}{c} \times \\ 2 \\ \times \end{array}}, \quad H_8^{(1,5)} = \boxed{1 \begin{array}{c} \times \\ 2 \\ \times \end{array} \begin{array}{c} \times \\ 3 \\ \times \end{array}},$$

$$H_9^{(1,5)} = \boxed{1 \begin{array}{c} \times \\ 2 \\ \times \end{array} \begin{array}{c} \times \\ 3 \\ \times \end{array} \begin{array}{c} \times \\ 4 \\ \times \end{array}}, \quad H_{10}^{(1,5)} = \boxed{1 \begin{array}{c} \times \\ 2 \\ \times \end{array} \begin{array}{c} \times \\ 3 \\ \times \end{array} \begin{array}{c} \times \\ 4 \\ \times \end{array} \begin{array}{c} \times \\ 5 \\ \times \end{array}},$$

$$H_{11}^{(1,5)} = \boxed{1 \begin{array}{c} \times \\ 2 \\ \times \end{array} \begin{array}{c} \times \\ 3 \\ \times \end{array} \begin{array}{c} \times \\ 4 \\ \times \end{array} \begin{array}{c} \times \\ 5 \\ \times \end{array} \begin{array}{c} \times \\ 1 \\ \times \end{array} \begin{array}{c} \times \\ 2 \\ \times \end{array}}$$

For  $r=2, N=7$ ,  $H_{10}^{(2,7)} = \boxed{1 \begin{array}{c} \times \\ 3 \\ \times \end{array}}, \quad H_{11}^{(2,7)} = \boxed{2 \begin{array}{c} \times \\ 4 \\ \times \end{array}},$   
 $H_{12}^{(2,7)} = \boxed{1 \begin{array}{c} \times \\ 3 \\ \times \end{array} \begin{array}{c} \times \\ 5 \\ \times \end{array}}, \quad H_{13}^{(2,7)} = \boxed{2 \begin{array}{c} \times \\ 4 \\ \times \end{array} \begin{array}{c} \times \\ 6 \\ \times \end{array}}, \quad H_{14}^{(2,7)} = \boxed{1 \begin{array}{c} \times \\ 3 \\ \times \end{array} \begin{array}{c} \times \\ 5 \\ \times \end{array} \begin{array}{c} \times \\ 7 \\ \times \end{array} \begin{array}{c} \times \\ 2 \\ \times \end{array}}$

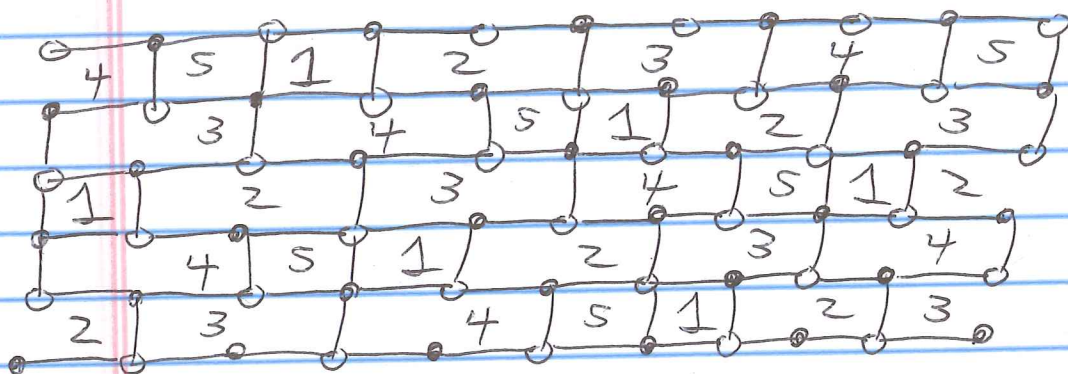

(2)

2) Glue the strips together:

$H_{n-(N-s)}^{(r,N)}$  to the top of  $H_n^{(r,N)}$ ,  $H_{n-s}^{(r,N)}$  to the bottom of  $H_n^{(r,N)}$

in the unique way so that is contained in  $\gamma^{(r,s,N)}$   
 Then continue, w/ gluing  $H_{n-2(N-s)}^{(r,N)}$  above,  $H_{n-2s}^{(r,N)}$  below  
 etc. until  $n-k(N-s)$  and  $n-ks$  are below ~~there~~  
 hence correspond to empty strips.

Example (Somos 5) Recall  $\gamma^{(1,2,5)}$  looks like

$$G_6^{(1,2,5)} = G_6 = \boxed{1} = H_6^{(1,5)}$$

$$G_7 = \boxed{1} \text{ --- } \boxed{2} = H_7^{(1,5)} \quad s=2, N-s=3, H_5^{(1,5)} = H_4^{(1,5)} = \emptyset$$

$$G_8 = \boxed{1} \text{ --- } \boxed{2} \text{ --- } \boxed{3} \text{ --- } \boxed{1} = H_8^{(1,5)} \cup H_6^{(1,5)} \text{ (below)}$$

$$G_9 = \boxed{1} \text{ --- } \boxed{2} \text{ --- } \boxed{3} \text{ --- } \boxed{4} \text{ --- } \boxed{1} \text{ --- } \boxed{2} = H_9^{(1,5)} \cup H_7^{(1,5)} \text{ (below)} \cup H_6^{(1,5)} \text{ (above)}$$

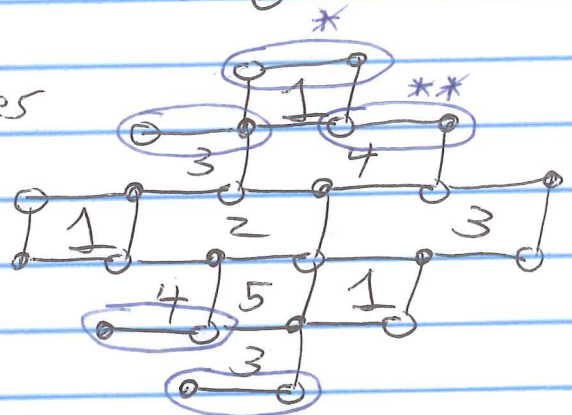

(3)

Equivalent to

Becomes

edges \* & \*\* only removed  
marked with  
after removal of the  
others lead to one of  
their vertices becoming leaves

Similarly,

$\gamma(M)$  defined by recording what faces need to be twisted  
to get from  $M_0 = \text{minimal matching} = \text{all horizontal edges}$  unique matching with

multiply by  $\gamma_i$  for each face  $[i]$  or  $[i^*]$  twisted

(4)  $\chi(M)$  defined as  $\prod X_i^{d - |M \cap \partial F_i|}$

faces  $F_i$   
 in  $G_n^{r,s,N} \cup \partial G_n^{r,s,N}$   
 in  $\mathcal{Z}^{(r,s,N)}$

$(F_i)$  labeled  $\bar{i}$

$\prod X_i$   
 closed faces  $F_{\bar{i}}$   
 in  $G_n^{r,s,N}$

where  $d$  defined from

closed face  $F_{\bar{i}}$  in  $G_n^{r,s,N}$  is a  $\mathbb{Z}^d$ -gon

OR open face  $F_i$  in  $\partial G_n^{r,s,N}$  borders  $G_n^{r,s,N}$  in  $\mathbb{Z}^d$  or  $\mathbb{Z}^d-1$  edges

Aztec Diamond Examples of  $\chi(M) \chi(M) / \mathbb{Z}^2$ -lattice

$$\frac{X_{00} X_{20}}{X_{10}} + \frac{X_{11} X_{1-1}}{X_{10}} Y_{10}$$

$$\frac{X_{-20} X_{00} X_{20}}{X_{-10} X_{10}} + \frac{X_{-11} X_{-1-1} X_{20}}{X_{-10} X_{10}} Y_{-10} + \frac{X_{-20} X_{11} X_{1-1}}{X_{-10} X_{10}} Y_{10}$$

$$\textcircled{5} + \frac{X_{-11} X_{11} X_{1-1} X_{-11}}{X_{-10} X_{00} X_{10}} Y_{-10} Y_{10} + \frac{X_{-11} X_{11} X_{1-1} X_{-1-1}}{X_{0-1} X_{00} X_{01}} Y_{-10} Y_{00} Y_{10}$$

There are a number of approaches to proving this combinatorial interpretation in the literature. See

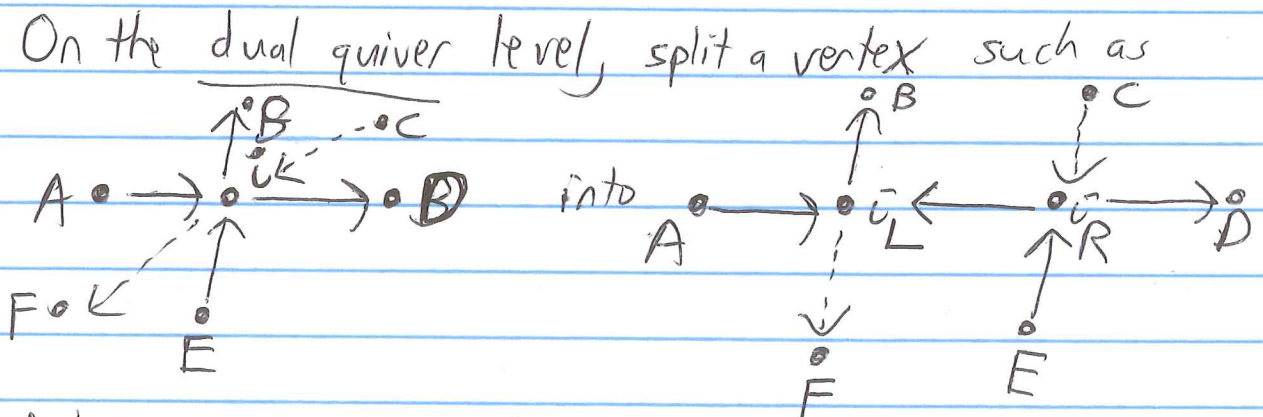

- Speyer '07 "Perfect Matchings and the Octahedron Recurrence"
- Bosquet-Melou-Propp-West '09 "Perf. matchings for the three-term Gale-Robinson seq's"
- Jeong-M-Zhang - FPSAC '12 Abstract "Gale-Robinson sequences and brane tilings"
- Di Francesco '13 "T-systems, networks and dimers"
- Vichitkunakorn '15 "Solutions to the T-systems with principal coefficients"
- R. Eager '10 "Brane Tilings and Non-commutative Geometry"
- and - Glick-Weyman '17 "Gale-Robinson Quivers: From Representation to Comb. Formulas"

using Kuo's Graphical Condensation

⑥ Since we already discussed the proof of this interpretation for  $\mathbb{Z}^2$ -lattice and Aztec Diamonds, like the Example we just discussed, we provide a method for reducing Gale-Robinson case to  $\mathbb{Z}^2$ -case like our approach reducing Pentagram Glick Quivers  $Q_n$  to  $\mathbb{Z}^2$ -case

By the way, see Kedem-Vichitkunakorn "T-systems and the Pentagram Map" '14 for a formal treatment of this reduction.

Take tiling  $\tau^{(r,s,N)}$  and split rectangular faces into two squares  $\bar{u}_L \bar{u}_R$  by imagining a vertical line bisecting them.

Note: as we go cyclically around vertex  $\bar{u}$ , we see a pattern alternating in-out in both cases.

Vertical edge  $\bar{u}_L \bar{u}_R$  corresponds to new arrow  $\bar{u}_L \leftarrow \bar{u}_R$ .

Turns the Gale-Robinson Quiver into a projection of an Octahedron Recurrence /  $\mathbb{Z}^2$ -Quivers. In fact, will be isomorphic to a Glick/pentagram  $Q_m$  quiver.

⑦ Eg. Somos-5

Becomes

$Q_4 \cong$

pentagram/Glick  
Quiver

We can thus break up our  $M_1, M_2, \dots, M_N$  mutation sequence into

$$\begin{array}{l}
 \underline{M_{\text{odd}} \circ M_{\text{even}}} \quad \left| \quad \text{e.g. } M_{\text{odd}} = 1, 2_R, 3_R, 4_R \right. \\
 \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad M_{\text{even}} = 2_L, 3_L, 4_L, 5
 \end{array}$$

In Speyer's Octahedron Recurrence Paper, he not only gives face weightings and  $X(M)$  associated to matchings, as above, but also gives edge weightings to incorporate into the formula.

Setting the corresponding parameters assoc to  $\tilde{u}_L \leftarrow \tilde{u}_R$  to zero degenerates to  $X_n$ 's &  $G_n^{\text{GR}}$  for Gale-Robinson sequence.

Then identity  $x_{\tilde{u}_L} = x_{\tilde{u}_R} = x_{\tilde{u}}$  throughout,  $y_{\tilde{u}}$ 's analogous but more complicated specialization.
