**Math 5651 Lecture 001 (V. Reiner) Midterm Exam II**  
**Thursday, March 29, 2018**

This is a 115 minute exam. No books, notes, calculators, cell phones, watches or other electronic devices are allowed. You can leave answers as fractions, with binomial or multinomial coefficients unevaluated.

There are a total of 100 points. To get full credit for a problem you must show the details of your work. Answers unsupported by an argument will get little credit. Do all of your calculations on this test paper.

Problem                      Score

1. \_\_\_\_\_  
 2. \_\_\_\_\_  
 3. \_\_\_\_\_  
 4. \_\_\_\_\_  
 5. \_\_\_\_\_

Total: \_\_\_\_\_

**Reminders:**

$$\Pr(A_1 \cup \dots \cup A_n) = \sum_{k=1}^n (-1)^{k-1} \sum_{1 \leq i_1 < \dots < i_k \leq n} \Pr(A_{i_1} \cap \dots \cap A_{i_k})$$

$$S = \sqcup_{i=1}^n B_i \Rightarrow \Pr(A) = \sum_{i=1}^n \Pr(A \cap B_i) = \sum_{i=1}^n \Pr(A|B_i)\Pr(B_i) \text{ and } \Pr(B_i|A) = \Pr(A|B_i)\Pr(B_i)/\Pr(A)$$

$$\text{cdf } F(x) := \Pr(X \leq x), \text{ while pdf } f(x) = \frac{\partial}{\partial x} F(x)$$

$$g_1(x|y) = f(x,y)/f_2(y), \quad g_2(y|x) = f(x,y)/f_1(x)$$

$$f_1(x) = \int_{y=-\infty}^{y=+\infty} f(x,y) dy, \quad f_2(y) = \int_{x=-\infty}^{x=+\infty} f(x,y) dx$$

When  $\underline{Y} = \underline{r}(X) \Leftrightarrow X = \underline{s}(Y)$ , then  $f(\underline{x}), g(\underline{y})$  satisfy  $g(\underline{y}) = f(\underline{s}(y)) \cdot |J|$  where  $J := \det \left( \frac{\partial s_i}{\partial y_j} \right)$

$$\mathbf{E}X = \begin{cases} \sum_k k \cdot f(k) & X \text{ discrete}, \\ \int_{-\infty}^{+\infty} xf(x) dx & X \text{ continuous}. \end{cases}$$

$X$	p.f. $f(k)$	$\mathbf{E}X$
$\text{Bin}(n, p)$	$\binom{n}{k} p^k (1-p)^{n-k}$ for $k \in \{0, 1, \dots, n\}$	$pn$
$\text{Hypergeom}(A, B, n)$	$\binom{A}{k} \binom{B}{n-k} / \binom{A+B}{n}$ for $k \in \{0, 1, \dots, \min\{A, n\}\}$	$\frac{A}{A+B} n$
$\text{Poi}(\lambda)$	$e^{-\lambda} \frac{\lambda^k}{k!}$ for $k \in \{0, 1, 2, \dots\}$	$\lambda$

**Problem 1.** (20 points total) Let  $X_1, X_2$  be a pair of random variables whose joint pdf has the form

$$f(x_1, x_2) = \begin{cases} cx_1 x_2 & \text{for } (x_1, x_2) \in [0, 1] \times [0, 1] \\ 0 & \text{otherwise,} \end{cases}$$

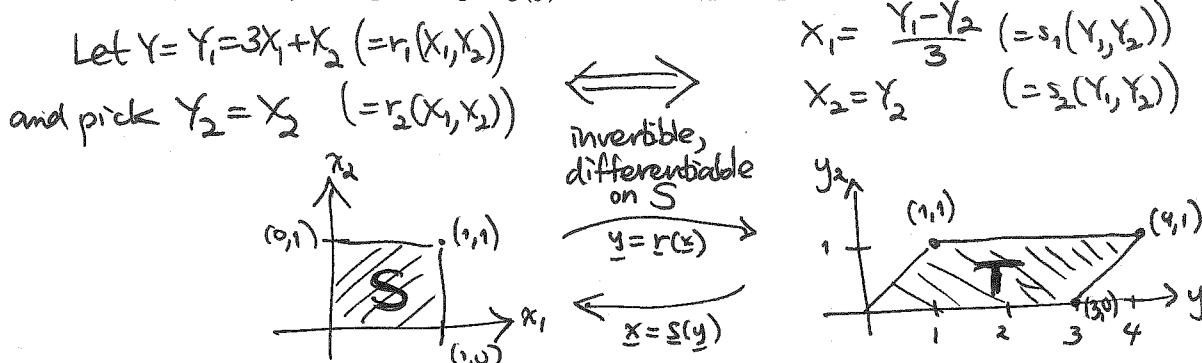

for some constant  $c$ .

- a. (5 points) Determine the constant  $c$ .

$$1 = \iint_{(x_1, x_2) \in \mathbb{R}^2} f(x_1, x_2) dx_1 dx_2 = \int_{x_1=0}^{x_1=1} \int_{x_2=0}^{x_2=1} cx_1 x_2 dx_2 dx_1 = c \int_{x_1=0}^{x_1=1} x_1 \left[ \frac{x_2^2}{2} \right]_{x_2=0}^{x_2=1} dx_1 = c \int_{x_1=0}^{x_1=1} x_1 dx_1 = \frac{c}{4}$$

$$\Rightarrow c = 4$$

- b. (15 points) Compute a pdf  $g(y)$  for  $Y = 3X_1 + X_2$ .

$$\text{Jacobian } J = \det \begin{bmatrix} \frac{\partial s_1}{\partial y_1} & \frac{\partial s_1}{\partial y_2} \\ \frac{\partial s_2}{\partial y_1} & \frac{\partial s_2}{\partial y_2} \end{bmatrix} = \det \begin{bmatrix} \frac{1}{3} & -\frac{1}{3} \\ 0 & 1 \end{bmatrix} = \frac{1}{3}$$

$$\text{and hence } (Y_1, Y_2) \text{ have joint pdf } g(y_1, y_2) = \begin{cases} f(s_1(y), s_2(y)) |J| = 4 \left( \frac{y_1 - y_2}{3} \right) y_2 \frac{1}{3} = \frac{4}{9} y_2 (y_1 - y_2) & \text{if } (y_1, y_2) \in T \\ 0 & \text{otherwise} \end{cases}$$

and  $Y = Y_1$  has pdf

$$g(y_1) = \int_{y_2 \in \mathbb{R}} g(y_1, y_2) dy_2 = \begin{cases} \frac{4}{9} \int_0^{y_1} y_2 (y_1 - y_2) dy_2 = \frac{4}{9} \left[ y_1 \frac{y_2^2}{2} - \frac{y_2^3}{3} \right]_0^{y_1} = \frac{4}{9} \left[ \frac{y_1^3}{2} - \frac{y_1^3}{3} \right] = \frac{2}{27} y_1^3 & \text{if } y_1 \in [0, 1] \\ \frac{4}{9} \int_0^1 y_2 (y_1 - y_2) dy_2 = \frac{4}{9} \left[ y_1 \frac{y_2^2}{2} - \frac{y_2^3}{3} \right]_0^1 = \frac{4}{9} \left[ \frac{y_1^2}{2} - \frac{1}{3} \right] & \text{if } y_1 \in [1, 3] \\ \frac{4}{9} \int_{y_1-3}^1 y_2 (y_1 - y_2) dy_2 = \frac{4}{9} \left[ y_1 \frac{y_2^2}{2} - \frac{y_2^3}{3} \right]_{y_1-3}^1 = \frac{4}{9} \left[ \frac{y_1}{2} - \frac{1}{3} - \frac{y_1(y_1-3)^2}{2} + \frac{(y_1-3)^3}{3} \right] & \text{if } y_1 \in [3, 4] \\ 0 & \text{otherwise} \end{cases}$$

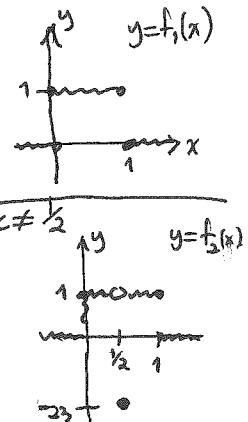

**Problem 2. (20 points total)**

True or False? Some explanation required for each answer.

- a. (3 points) For a *continuous* random variable  $X$ , its *pdf*  $f(x)$  is uniquely determined.

**FALSE**, e.g.  $X = \text{Unif}(0,1)$  has a pdf  $f_1(x) = \begin{cases} 1 & \text{if } x \in (0,1) \\ 0 & \text{otherwise} \end{cases}$

$$\text{but also a pdf } f_2(x) = \begin{cases} 1 & \text{if } x \in (0,1), x \neq \frac{1}{2} \\ -23 & \text{if } x = \frac{1}{2} \\ 0 & \text{otherwise} \end{cases}$$

- b. (3 points) For a *continuous* random variable  $X$ , its *cdf*  $F(x)$  is uniquely determined.

**TRUE**, since the cdf value  $F(x) = \Pr(X \leq x)$

- c. (3 points) For a *discrete* random variable  $X$ , its *pf*  $f(x)$  is uniquely determined.

**TRUE**, since pf value  $f(x) = \Pr(X=x) (= \Pr(X \in \{x\}))$

- d. (3 points) For a *discrete* random variable  $X$ , its *cdf*  $F(x)$  is uniquely determined.

**TRUE**, since the cdf value  $F(x) = \Pr(X \leq x)$

- e. (4 points) There exists a continuous random variable  $X$  having a pdf

$$f(x) = \begin{cases} \frac{1}{4}(x-1) & \text{for } x \in [0, 4], \\ 0 & \text{otherwise.} \end{cases}$$

**FALSE**, since  $f(x) < 0$  for  $x \in [0, 1]$

- f. (4 points) If  $(X, Y)$  are random variables with a joint pdf given by

$$f(x, y) = \begin{cases} 5x^4 & \text{for } (x, y) \in [0, 1] \times [0, 1], \\ 0 & \text{otherwise.} \end{cases}$$

then  $X$  and  $Y$  are *dependent*.

**FALSE**, since  $(X, Y)$  are independent, due to the fact that  $f(x, y) = f_1(x)f_2(y)$  where  $f_1(x) = \begin{cases} 5x^4 & \text{if } x \in [0, 1] \\ 0 & \text{otherwise} \end{cases}$  ( $\forall (x, y) \in \mathbb{R}^2$ )  $f_2(y) = \begin{cases} 1 & \text{if } y \in [0, 1] \\ 0 & \text{otherwise} \end{cases}$

**Problem 3. (20 points total)** Let  $X$  be a random variable with a pdf

$$f(x) = \begin{cases} \frac{3}{4}x(2-x) & \text{for } x \in [0, 2], \\ 0 & \text{otherwise.} \end{cases}$$

a. (10 points) Calculate its expected value  $EX$ .

$$EX = \int_{x \in \mathbb{R}} xf(x) dx = \int_0^2 x \cdot \frac{3}{4}x(2-x) dx = \frac{3}{4} \int_0^2 (2x^2 - x^3) dx = \frac{3}{4} \left[ \frac{2}{3}x^3 - \frac{1}{4}x^4 \right]_0^2 = \frac{3}{4} \left( \frac{16}{3} - \frac{16}{4} \right) = 1$$

b. (10 points) Find a pdf  $g(y)$  for the new random variable  $Y = X^5$ .

Indicate clearly when  $g(y)$  is zero.

Since  $y = x^5$  is differentiable and monotone increasing for  $x \in (0, 2)$

$$\left( \frac{dy}{dx} = 5x^4 \right)$$

$$\left( \frac{dy}{dx} = 5x^4 > 0 \right)$$

we can use the direct method:

$$y = x^5 = r(x) \text{ has inverse function } x = y^{\frac{1}{5}} = s(y)$$

$$\frac{ds}{dy} = \frac{1}{5}y^{-\frac{4}{5}}$$

$$\Rightarrow Y \text{ has pdf} \\ g(y) = \begin{cases} f(s(y)) \left| \frac{ds}{dy} \right| & \text{if } y \in r([0, 2]) = [0, 2^5] = [0, 32] \\ 0 & \text{otherwise} \end{cases}$$

note  $\frac{1}{5}y^{-\frac{4}{5}} > 0$  for  $y \in [0, 32]$

$$= \begin{cases} \frac{3}{4}y^{\frac{1}{5}}(2-y^{\frac{1}{5}}) \left| \frac{1}{5}y^{-\frac{4}{5}} \right| & \leftarrow = \frac{3}{20}y^{\frac{3}{5}}(2-y^{\frac{1}{5}}) \quad \# y \in [0, 32] \\ 0 & \text{otherwise} \end{cases}$$

**Problem 4.** (20 points total) A group of  $n$  restaurant patrons named Person 1, Person 2, ..., Person  $n$  each give their hat to the hat-check attendant. Later, the attendant gives them each back a hat, uniformly at random, that is, all distributions are equally likely.

- a. (5 points) What is the probability that Person 1 and Person 2 end up with swapped hats, that is, Person 1 receives the hat of Person 2 and Person 2 receives the hat of Person 1?

$$S = \{\text{all distributions}\} \text{ has } |S| = n!$$

$$A = \{\text{those where 1 \& 2 swap hats}\} \text{ has } |A| = (n-2)! \quad \begin{matrix} \nearrow \\ \text{Pick the distribution} \\ \text{for } 3, 4, \dots, n \end{matrix}$$

$$\Rightarrow \Pr(A) = \frac{|A|}{|S|} = \frac{(n-2)!}{n!} = \frac{1}{n(n-1)}$$

- b. (15 points) Let  $X$  denote the random variable which is the number of pairs  $(i, j)$  with  $1 \leq i < j \leq n$  for which Person  $i$  and Person  $j$  end up with swapped hats. Compute the expected value  $\mathbb{E}X$ .

Note that  $X = \sum_{\substack{\text{pairs } (i,j) \\ \text{with } 1 \leq i < j \leq n}} X_{ij}$ , where  $X_{ij} = \begin{cases} 1 & \text{if } i \& j \text{ swapped hats} \\ 0 & \text{otherwise} \end{cases}$

Linearity of  
expectation  
 $\implies$

$$\begin{aligned} \mathbb{E}X &= \sum_{(i,j)} \mathbb{E}X_{ij}; \text{ where } \mathbb{E}X_{ij} = \Pr(\{i \& j \text{ swapped hats}\}) \\ &= \Pr(\{1 \& 2 \text{ swapped hats}\}) \\ &= \frac{1}{n(n-1)} \text{ by part (a)} \\ &= \#\{\text{pairs } (i,j) \text{ with } 1 \leq i < j \leq n\} \cdot \frac{1}{n(n-1)} \\ &= \binom{n}{2} \frac{1}{n(n-1)} = \frac{n(n-1)}{2} \cdot \frac{1}{n(n-1)} = \frac{1}{2} \end{aligned}$$

**Problem 5.** (20 points total) Define a pair of random variables  $(X, Y)$  by first picking  $X$  uniformly from the interval  $[0, 1]$ , and then, knowing the value  $X = x$ , let  $Y = \text{Bin}(3, x)$  be a binomial random variable with parameters  $n = 3$  and  $p = x$ .

- a. (5 points) Write down a joint pdf  $f(x, y)$  for  $(X, Y)$ , indicating clearly when  $f(x, y) = 0$ .

$$X = \text{Unif}(0, 1) \text{ has pdf } f_1(x) = \begin{cases} 1 & \text{if } x \in (0, 1) \\ 0 & \text{otherwise} \end{cases}$$

$$Y = \text{Bin}(3, x) \text{ has pf } g_2(y|x) = \begin{cases} \binom{3}{y} x^y (1-x)^{3-y} & \text{if } y \in \{0, 1, 2, 3\} \\ 0 & \text{otherwise} \end{cases}$$

$\Rightarrow (X, Y)$  has joint pdf/pdf

$$f(x, y) = g_2(y|x)f_1(x) = \begin{cases} \binom{3}{y} x^y (1-x)^{3-y} & \text{if } x \in (0, 1) \text{ and } y \in \{0, 1, 2, 3\} \\ 0 & \text{otherwise} \end{cases}$$

$\frac{\text{pdf}}{\text{pdf}}$

- b. (10 points) Write down a marginal pdf  $f_2(y)$  for  $Y$ , again indicating clearly when  $f_2(y) = 0$ .

$$f_2(y) = \int_{x \in \mathbb{R}} f(x, y) dx = \int_{x=0}^{x=1} \binom{3}{y} x^y (1-x)^{3-y} dx \quad \text{if } y \in \{0, 1, 2, 3\}$$

$$= \begin{cases} \int_0^1 (1-x)^3 dx = \int_0^1 (1-3x+3x^2-x^3) dx = \left[ x - \frac{3x^2}{2} + x^3 - \frac{x^4}{4} \right]_0^1 = \frac{1}{4} \\ 3 \int_0^1 x(1-x)^2 dx = 3 \int_0^1 (x-2x^2+x^3) dx = 3 \left[ \frac{x^2}{2} - \frac{2x^3}{3} + \frac{x^4}{4} \right]_0^1 = \frac{1}{4} \\ 3 \int_0^1 x^2(1-x) dx = 3 \int_0^1 (x^2-x^3) dx = 3 \left[ \frac{x^3}{3} - \frac{x^4}{4} \right]_0^1 = \frac{1}{4} \\ \int_0^1 x^3 dx = \left[ \frac{x^4}{4} \right]_0^1 = \frac{1}{4} \\ 0 & \text{otherwise} \end{cases}$$

- c. (5 points) Write down a conditional pdf  $g_1(x|2)$  for  $X$  given that  $Y = 2$ , again indicating clearly when  $g_1(x|2) = 0$ .

$$g_1(x|2) = \frac{f(x, 2)}{f_2(2)} = \begin{cases} \frac{\binom{3}{2} x^2 (1-x)^{3-2}}{\frac{1}{4}} = 12x^2(1-x) & \text{if } x \in (0, 1) \\ 0 & \text{otherwise} \end{cases}$$
