CSP

Dendro-  
distinctivity

## Definition

A **partition**  $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_k)$  is a finite sequence of weakly decreasing positive integers.

Partitions have an associated Ferrers diagram of boxes, where the number of boxes in the  $i$ th row is equal to the  $i$ th integer in the sequence.

## Example

The partition  $(8, 7, 4, 4, 3, 1)$  is represented as

# Young's Lattice

Symmetry

Combinatorics

Bijactions

CSP

Dendro-  
distinctivity

## Theorem (R. Suter)

*The graph of  $\mathcal{Y}_2^k$  has  $(k + 1)$ -fold cyclic symmetry.*

Proof idea: R. Suter gives an explicit cyclic action on partitions to realize this symmetry.

# R. Suter's Symmetry

We see the symmetry by drawing the Hasse diagram of  $\mathcal{Y}_2^k$  and then remembering only the underlying graph structure. The picture below illustrates this for  $k = 4$ .

## Example

## Definition

The **hook length** of a box in a Ferrers diagram is the number of boxes  $k$  below and to the right of that box.

## Definition

A  $(k + 1)$ -**core** is a partition with no hook length of size  $(k + 1)$ .

## Example

$(5, 3, 1, 1)$  is a 3-core:

|   |   |   |   |   |
|---|---|---|---|---|
| 8 | 5 | 4 | 2 | 1 |
| 5 | 2 | 1 |   |   |
| 2 |   |   |   |   |
| 1 |   |   |   |   |

CSP

Dendro-  
distinctivity

Form an **abacus display** with  $(k + 1)$  runners (labeled  $0, 1, \dots, k$ ) by breaking the infinite binary word into consecutive runs of length  $(k + 1)$  and stacking them.

## Example

(2) It has the **boundary word**  $\dots 011110011100101 \dots$

(3) We split this to make  $\dots |01111|00111|00101| \dots$

The **abacus display** is

|  |   |   |   |   |   |
|--|---|---|---|---|---|
|  | 0 | 1 | 1 | 1 | 1 |
|  | 0 | 0 | 1 | 1 | 1 |
|  | 0 | 0 | 1 | 0 | 1 |

# Cores to Words

The 1s in the display of  $(k + 1)$ -cores have columns **flush to the top**. We may just record the number of 1s in each column.

## Example

(3) We split this to make ... |01111|00111|00101| ....

(4) The corresponding **word** is

|       |   |   |   |   |
|-------|---|---|---|---|
| 0     | 1 | 1 | 1 | 1 |
| 0     | 0 | 1 | 1 | 1 |
| 0     | 0 | 1 | 0 | 1 |
| <hr/> |   |   |   |   |
| 0     | 1 | 3 | 2 | 3 |

# Cores to Words

Suter's

## Example

- 1 Let  $\mathcal{W}_4^2$  be the set of words of length 3 on  $\{0, 1, 2, 3\}$  that sum to 3 (mod 4),
- 2  $\mathcal{W}_4^2(q) = (1 + q + q^2 + q^3)(1 + q^2 + q^4 + q^6)$ , and
- 3  $C_3$  act on  $\mathcal{W}_4^2$  by left rotation.

We have five orbits of size 3 and one orbit of size 1.

For  $\omega$  a cube root of unity, we verify that

- 1  $\mathcal{W}_4^2(\omega) = \mathcal{W}_4^2(\omega^2) = (1 + \omega + \omega^2 + \omega^3)(1 + \omega^2 + \omega^4 + \omega^6) = 1$   
(one element is fixed by a single rotation)

## Definition

Define an infinite complete  $m$ -ary tree  $\mathcal{T}_m$  on partitioned words  $\underline{\mathbf{w}}$  by

- 1 The 0th level consists of the empty word  $\cdot$ , partitioned as
$$\cdot = \cdot \big|_1 \cdot \big|_2 \cdot \cdots \big|_0 \cdot$$
- 2 The children of a word  $\underline{\mathbf{w}}$  are the  $m$  words obtained by prepending  $-i$  to the  $i$ th block.

# Example

## Example

$\underline{\mathbf{w}} = 2003 \underset{0}{|} \underset{1}{1} \underset{2}{|} 031 \underset{3}{|} 1$  is in  $\underline{\mathcal{T}}_4$ .

The existence of the inverse map from  $\mathcal{W}_m^k$  to  $\mathcal{X}_m^k$  is equivalent to the following theorem, which shows one can recover the partitioning of a word.

## Theorem (Dendrodistinguishability, H. Thomas)

*Let  $\mathcal{T}_m$  be the infinite complete  $m$ -ary tree obtained from  $\underline{\mathcal{T}}_m$  by forgetting the partitionings. Then each word of length  $k$  on  $\{0, 1, \dots, m-1\}$  appears exactly once.*
